Limiti ventilatori nella BPCO

Dr. Pierantonio Laveneziana

Service d' Explorations Fonctionnelles de la Respiration, de l'Exercice et de la Dyspnée (EFRED)
Département "R3S" (Respiration, Réanimation, Réhabilitation, Sommeil)

Groupe Hospitalier Pitié-Salpêtrière Charles Foix
Assistance Publique-Hôpitaux de Paris

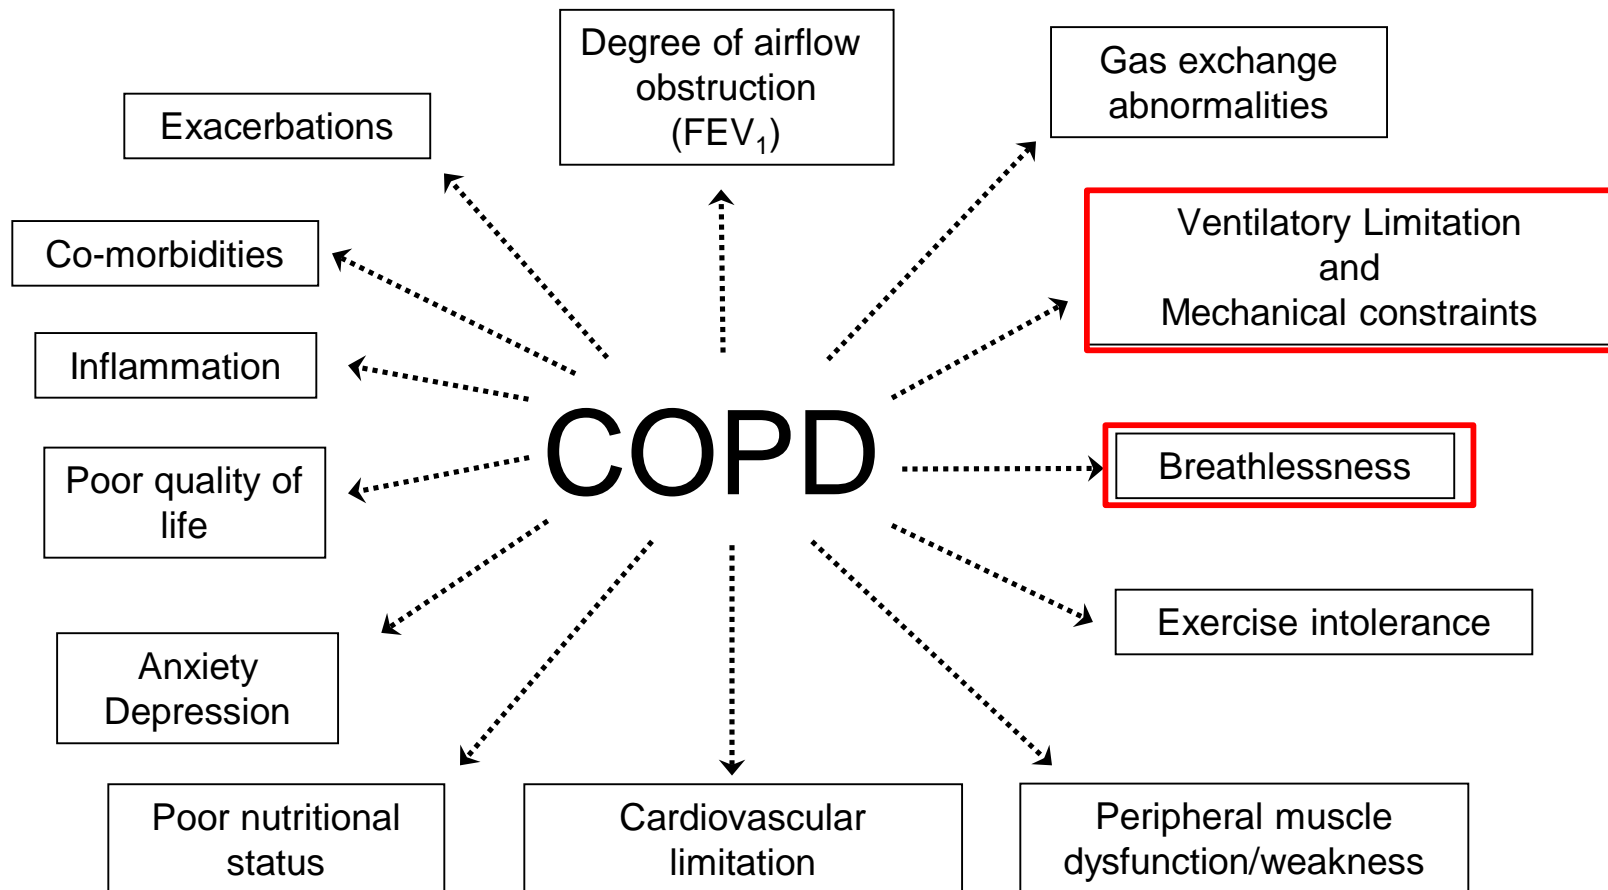

Sorbonne Universités, UMR_S 1158, INSERM et Université Pierre et Marie Curie (Paris 6)
Neurophysiologie Respiratoire Expérimentale et Clinique

Conflicts of interest

- Nothing to disclose

COPD

AGENDA

- **Ventilatory Mechanics**
 - ✓ **Ventilatory response and limitation**
 - ✓ **Flow-Volume Loops**
 - ✓ **Lung Hyperinflation**
 - ✓ **Tidal volume constraints**

- **Exertional Dyspnoea**

- Expiratory flow-limitation → ↑ EELV
- Functional respiratory muscle weakness
- ↑ Ventilatory muscle mechanical loading

- Metabolic demand

$$V'_E = \frac{863 * V'CO_2}{PaCO_2 * (1 - V_D/V_T)}$$

CO₂ set-point

- Alveolar-capillar gas diffusion
- Physiological dead space → V/Q abnormalities
- Gas exchange efficiency

Reflexes:
chemo,metabo, ergo

COPD

Alveolar Wall Destruction
Air Spaces Enlargement

Alveolar Attachments
Loss

Capillary Network
Reduction

Small Airways
Narrowing-Distortion

Nonhomogeneous
Inspired Air Distribution

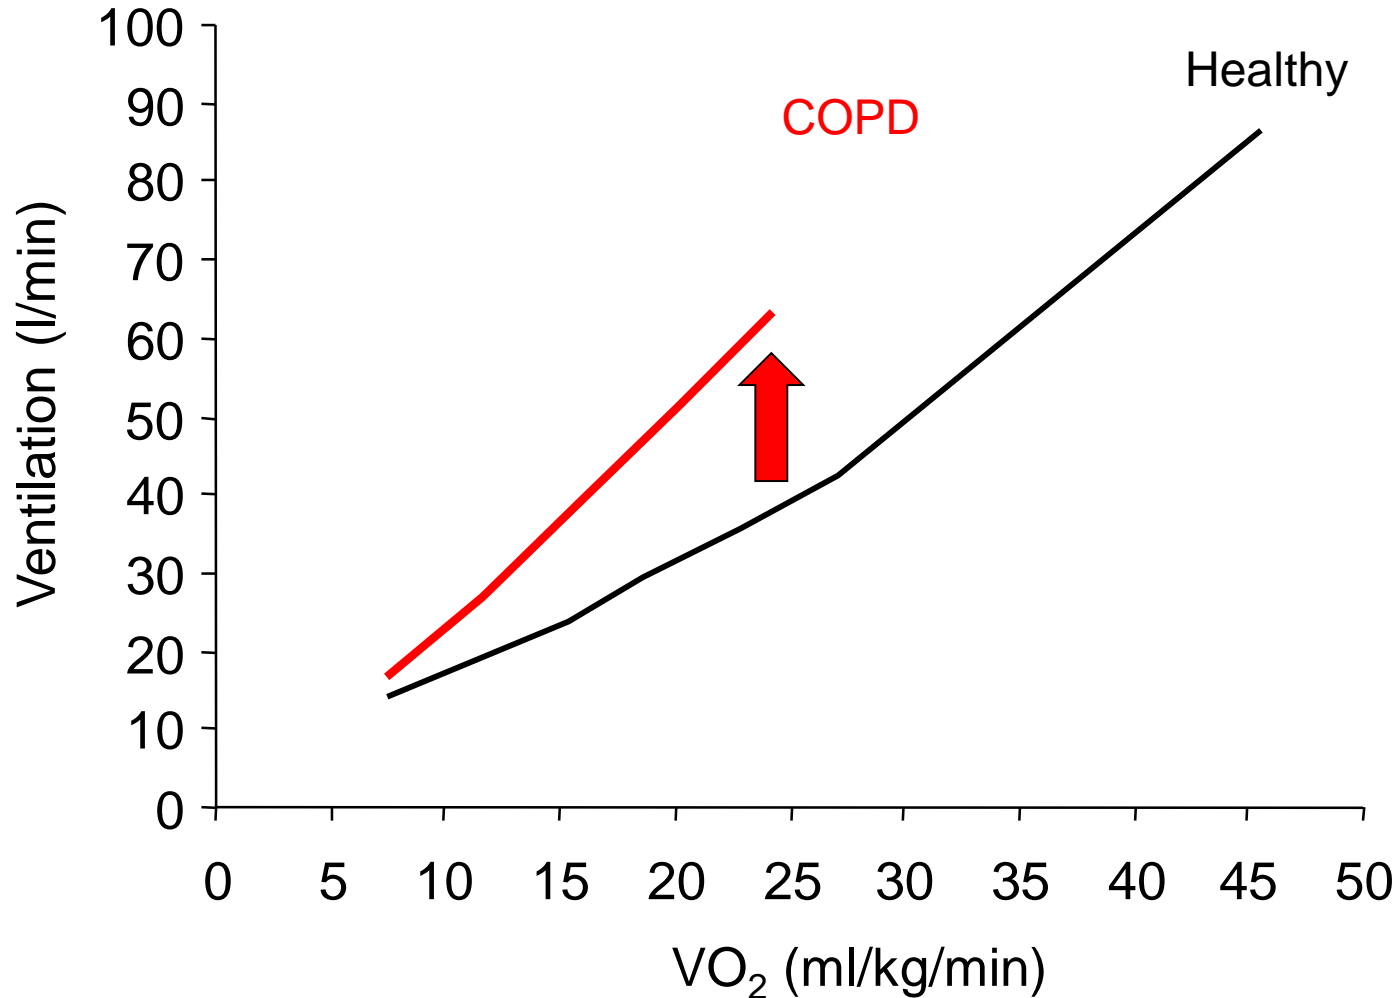

Reduced Ventilation
In Dependent Alveoli

HIGH V_A/Q RATIOS

LOW V_A/Q RATIOS

- Excessive submaximal V'_E
- $\uparrow V_D/V_T$ which does not decrease during exercise or normal V_D/V_T
- Mild drop in exercise PaO_2 or normal PaO_2
- $PaCO_2$ normal or \uparrow

Ventilatory response to exercise

Ventilatory (or breathing) reserve = VE peak/MVV, %

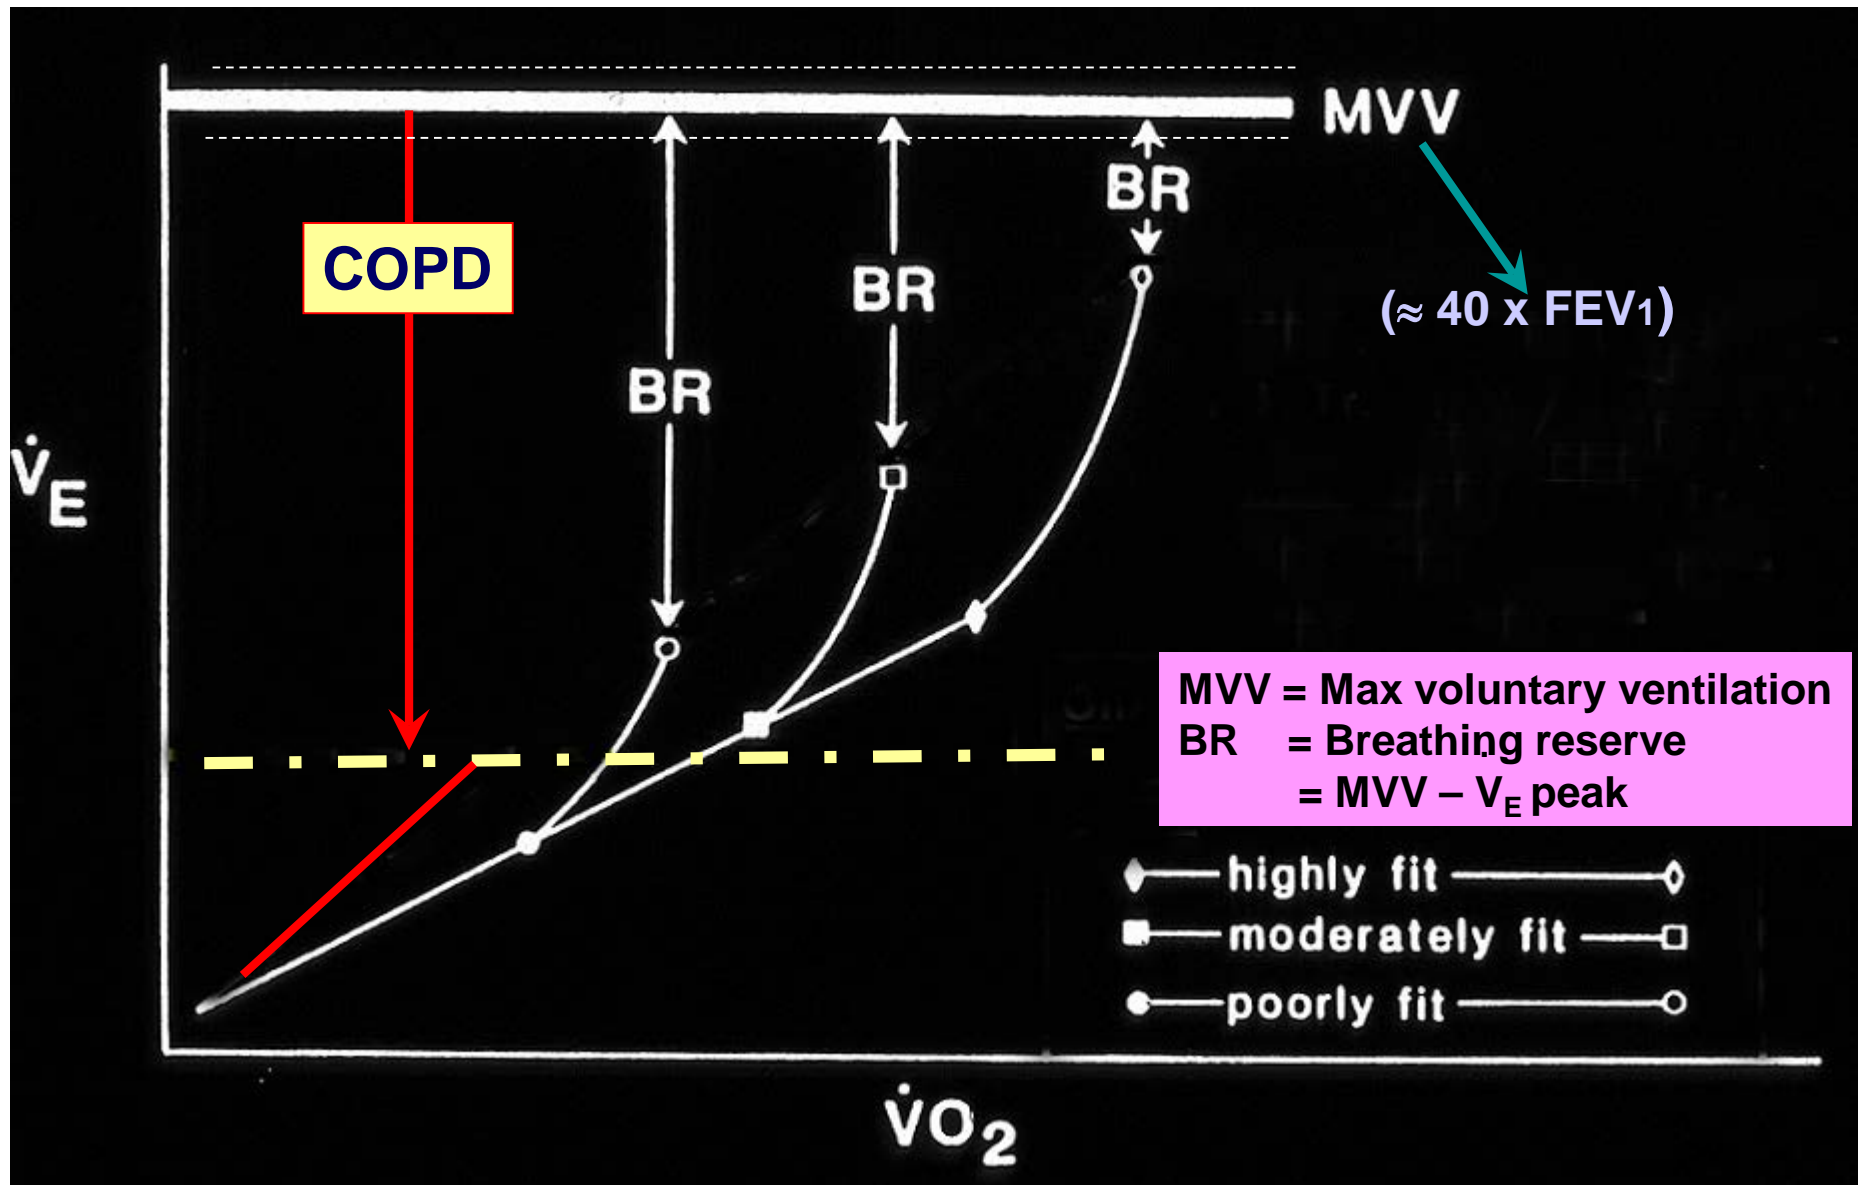

$$\text{MVV (MVC)} = \text{FEV}_1 \times 40 \text{ (30-40)}$$

MVV = maximal voluntary ventilation
MVC = maximal ventilatory capacity

$$\text{FEV}_1 = 3.0\text{L} \rightarrow 120\text{L}$$

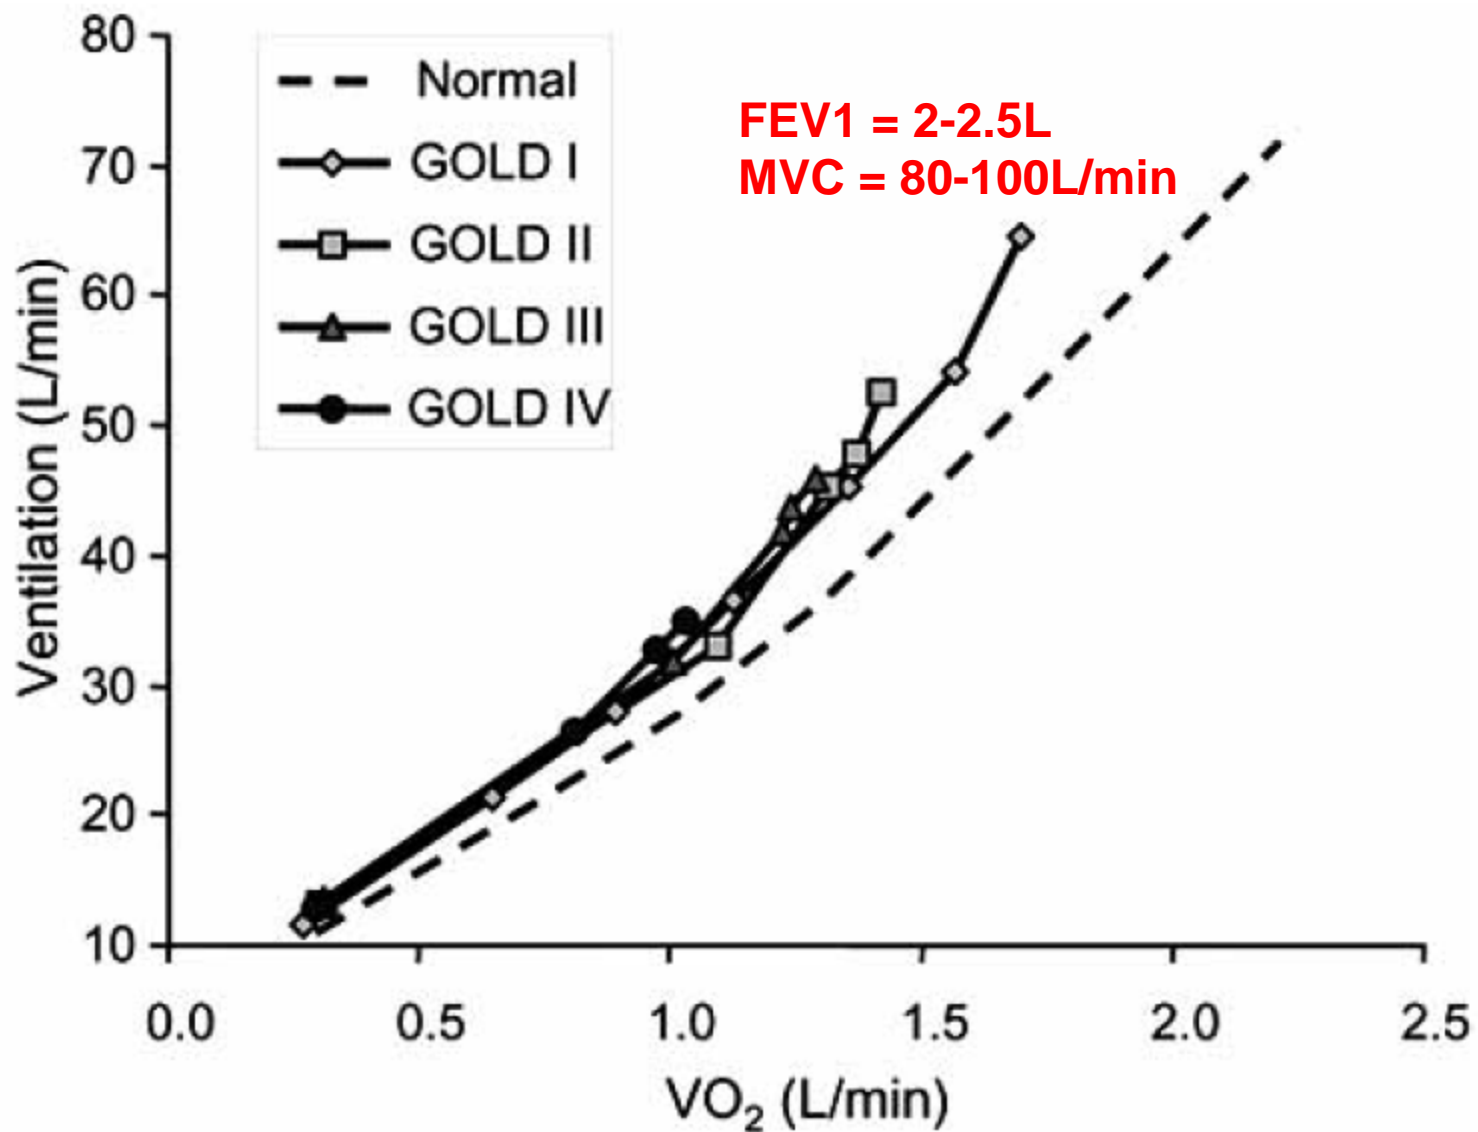

$$\text{FEV}_1 = 1.5\text{L} \rightarrow 60\text{L}$$

$$\text{FEV}_1 = 0.5\text{L} \rightarrow 20\text{L}$$

\dot{V}_E peak = $72 \pm 15\%$
 \dot{V}_E peak = $<80-85\%$
 VR (or BR) $> 20\%$ or $> 15 L$

Ventilatory Limitation

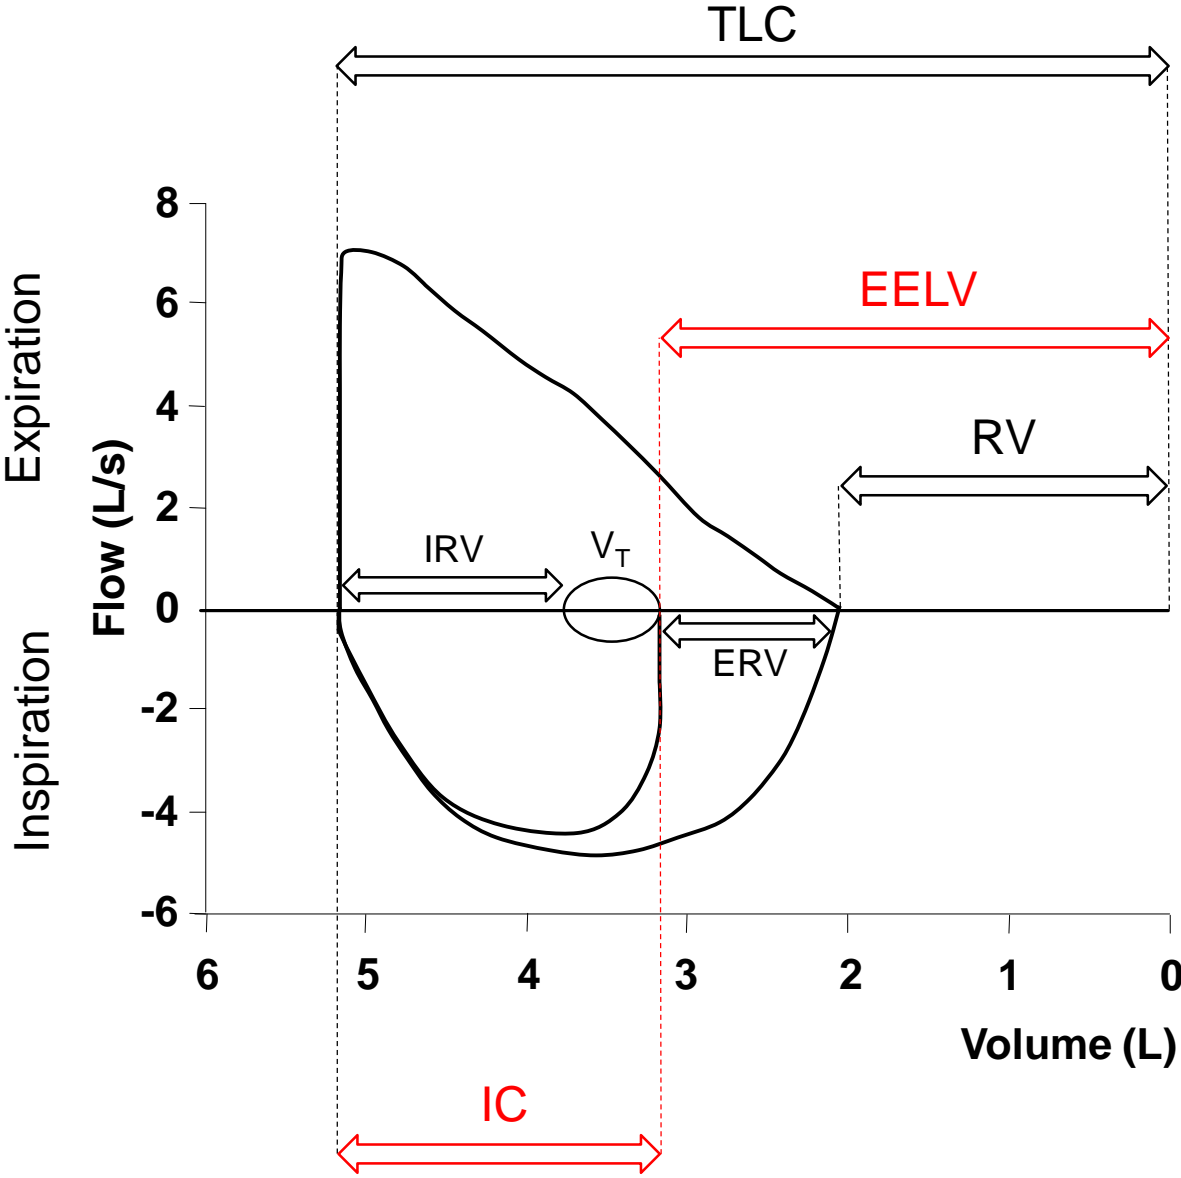

Ventilatory Limitation ???

VE peak <80-85%

VR (or BR) > 20% or > 15 L

- **mild COPD**
- **asthma**
- **CHF**
- **PAH**

Ventilatory Mechanics: Healthy

Ventilatory Mechanics: Healthy

Ventilatory Mechanics: Healthy

Ventilatory Mechanics: Healthy vs COPD

Older Male

Age = 66 yrs

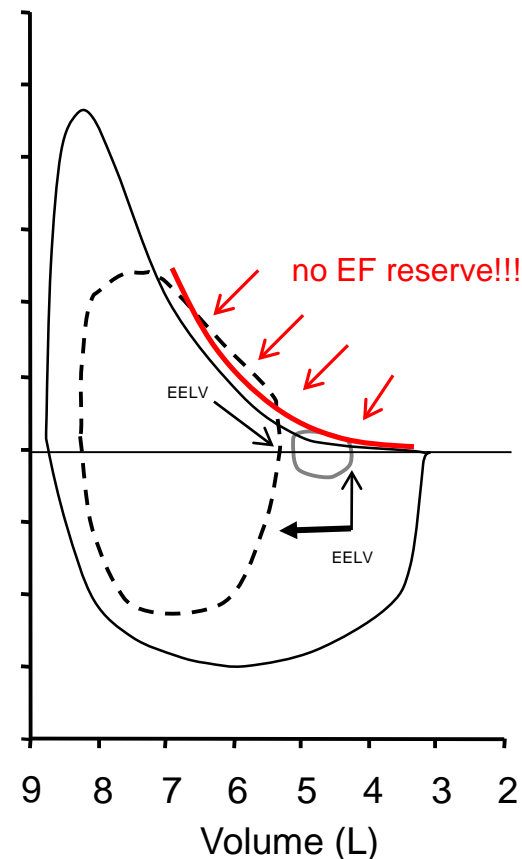

Mild COPD

Age = 67 yrs

Severe COPD

Age = 65 yrs

Dynamic Lung Hyperinflation

Ventilatory Mechanics: Healthy vs COPD

- **Dynamic hyperinflation: a temporary and variable increase in end expiratory lung volume (EELV) beyond its baseline value**
- **EELV: volume of gas left in the lung at the end of a quiet breath out**

Normal

COPD

Normal

COPD

**Expiratory
flow limitation**

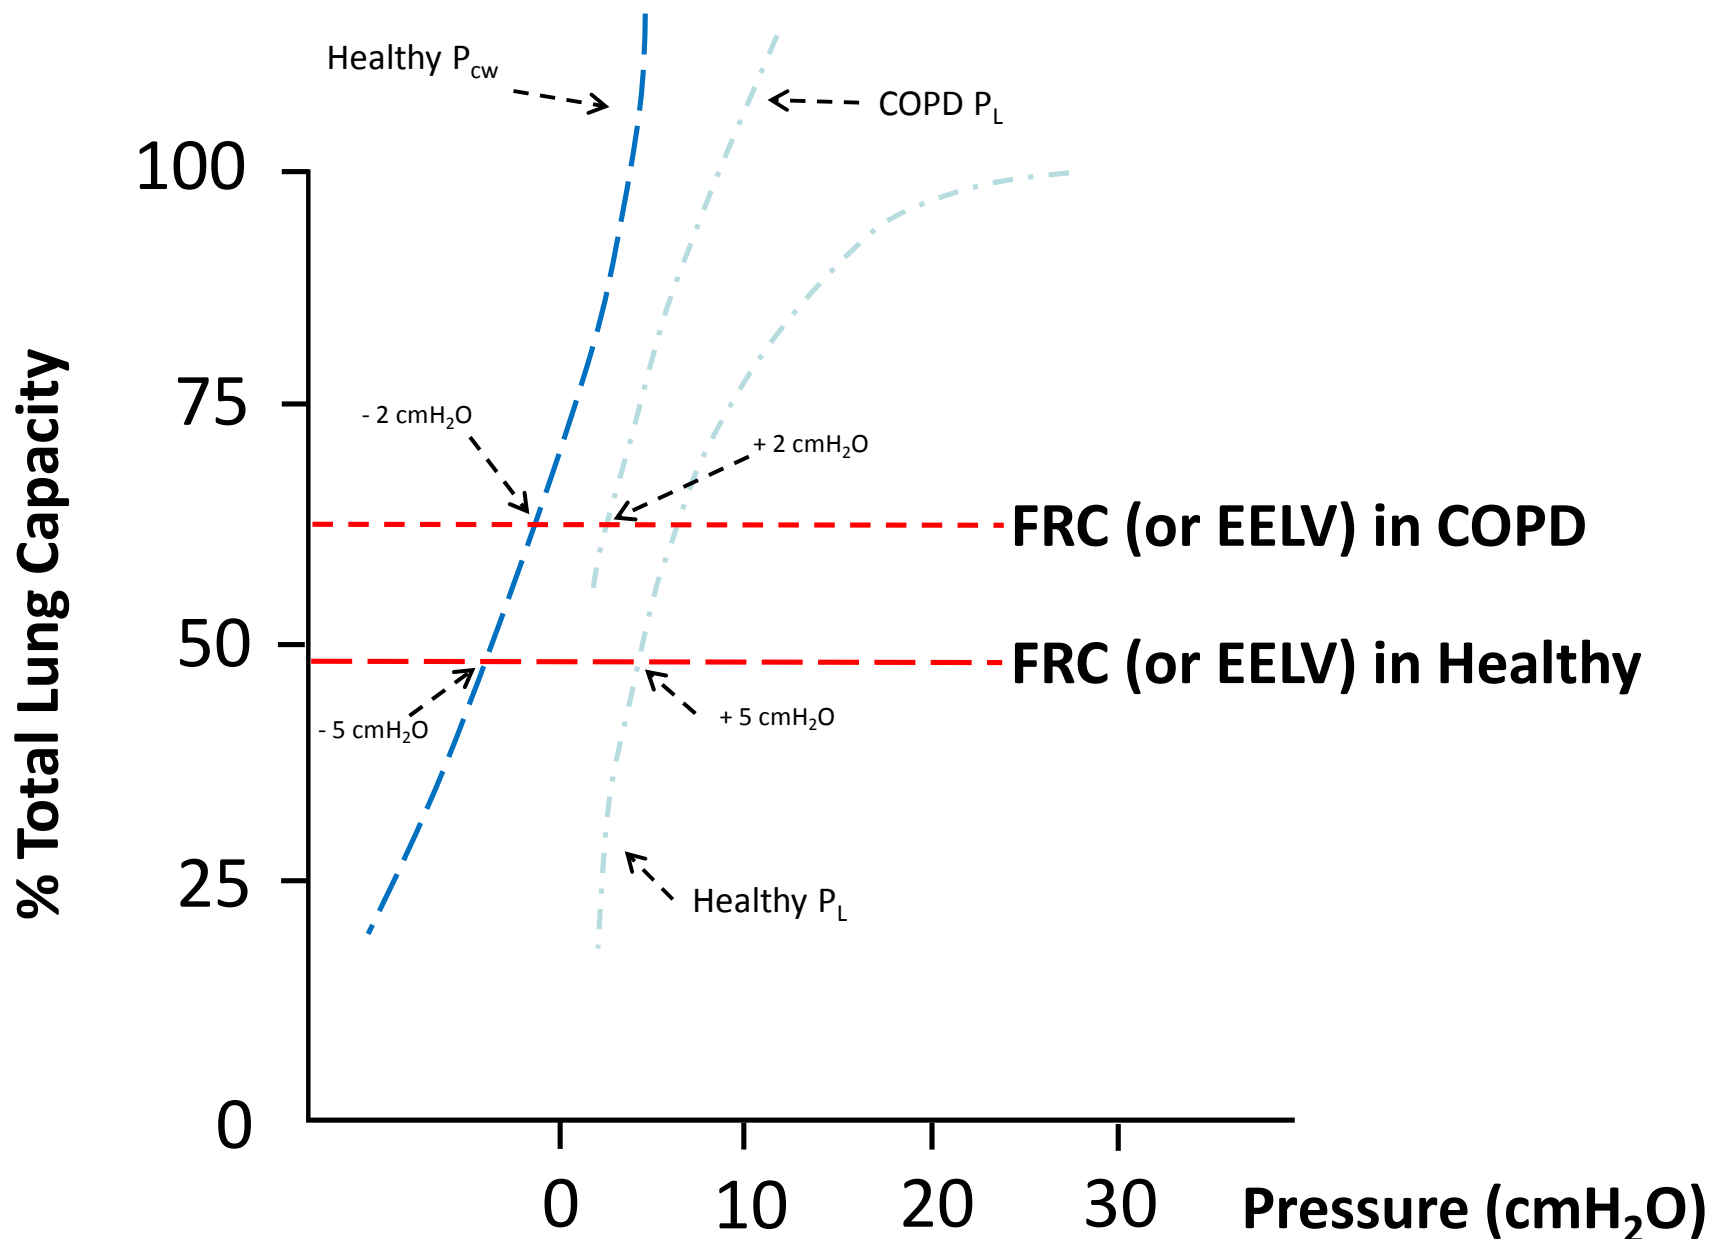

V_T

T_E

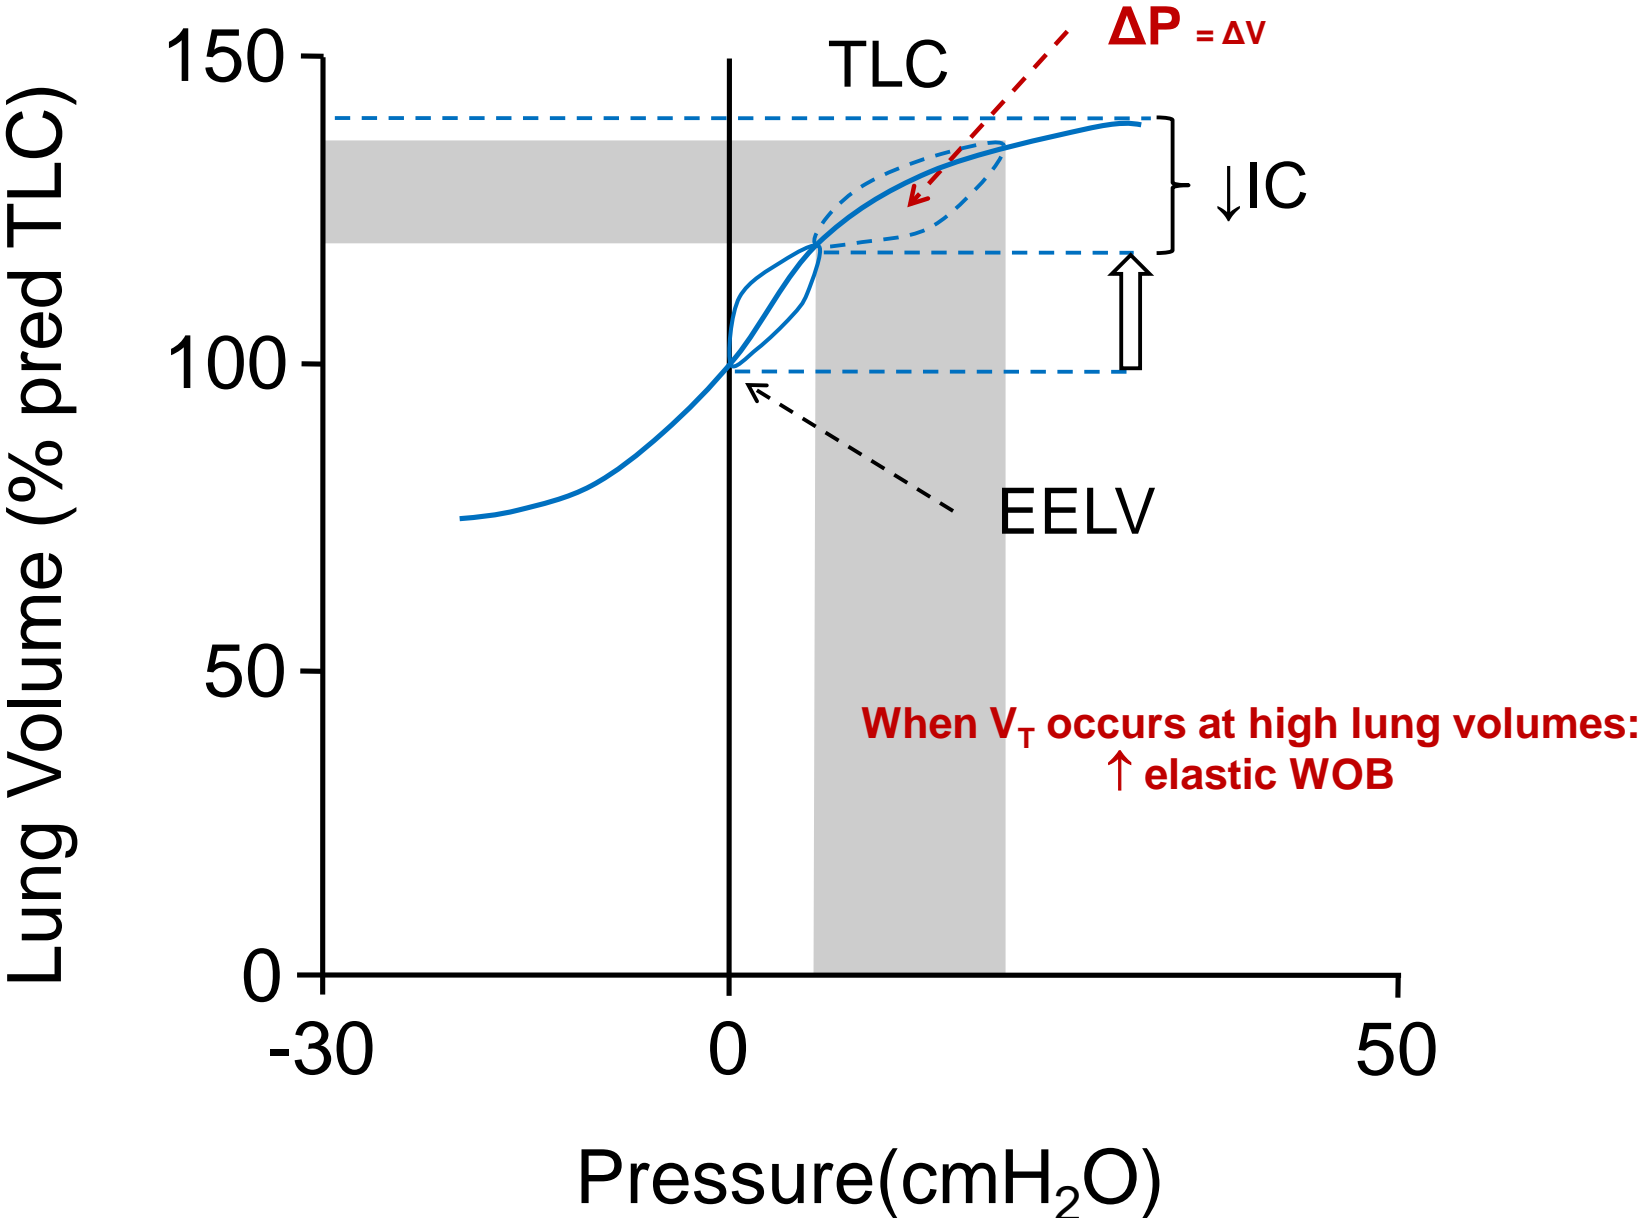

$\tau = C * R$

$$EELV - V_r = V_T / (e^{T_E / \tau} - 1)$$

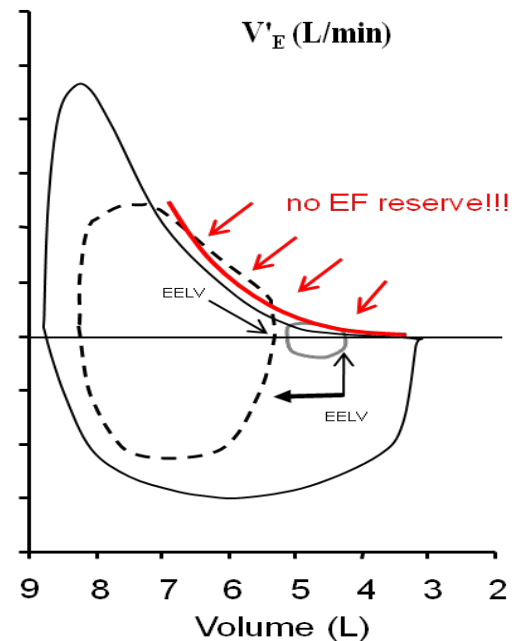

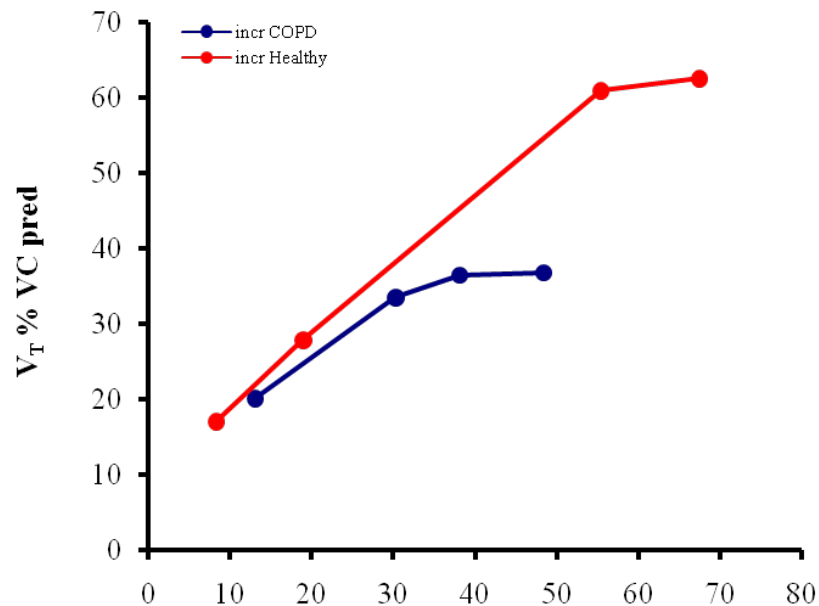

Ventilatory Mechanics: Healthy vs COPD

Ventilatory Mechanics: COPD

Ventilatory Mechanics: COPD

Breathing Pattern during Exercise with Worsening FEV₁ Quartile

- \uparrow Elastic/threshold loads
 - Inspiratory muscle weakness
- } $\uparrow P_{es}/P_{I_{max}}$ 'effort'
- Reduced V_T expansion
→ tachypnoea
- } $\downarrow C_{L_{dyn}}$
 $\uparrow V_D/V_T$
 $\uparrow PaCO_2$
- Early ventilatory limitation to exercise
 - Cardiac impairment
 - \uparrow Exertional dyspnoea

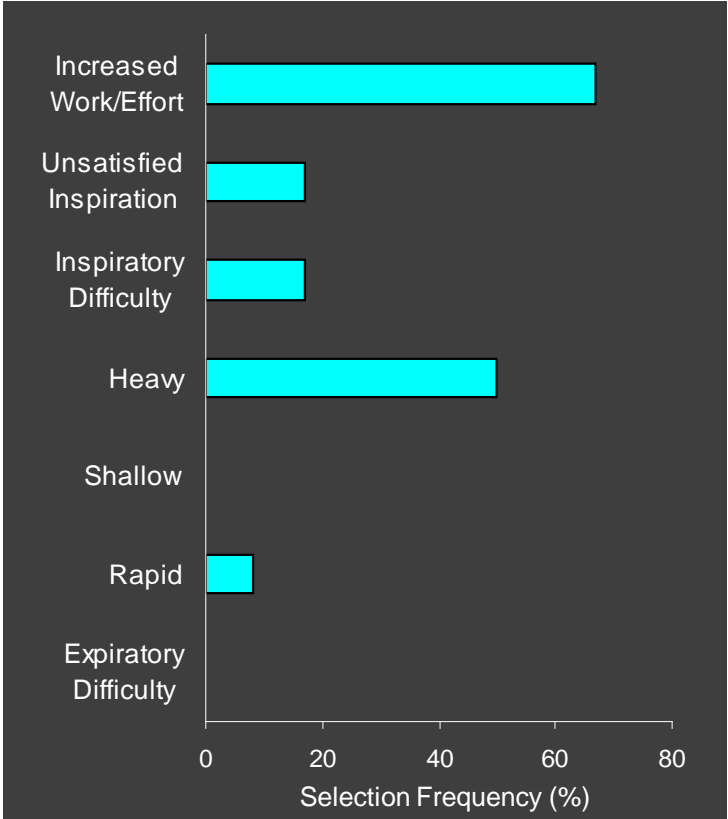

AGENDA

- **Ventilatory Mechanics**
 - ✓ **Ventilatory response and limitation**
 - ✓ **Flow-Volume Loops**
 - ✓ **Lung Hyperinflation**
 - ✓ **Tidal volume constraints**
- **Exertional Dyspnoea**

Exertional Dyspnoea in Healthy during exercise

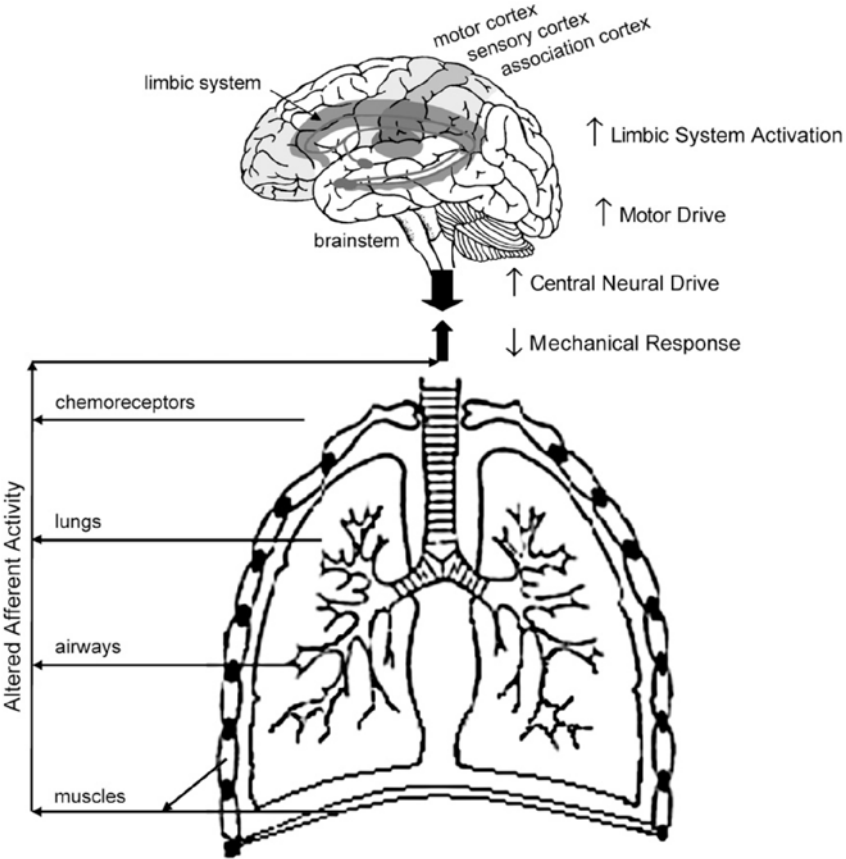

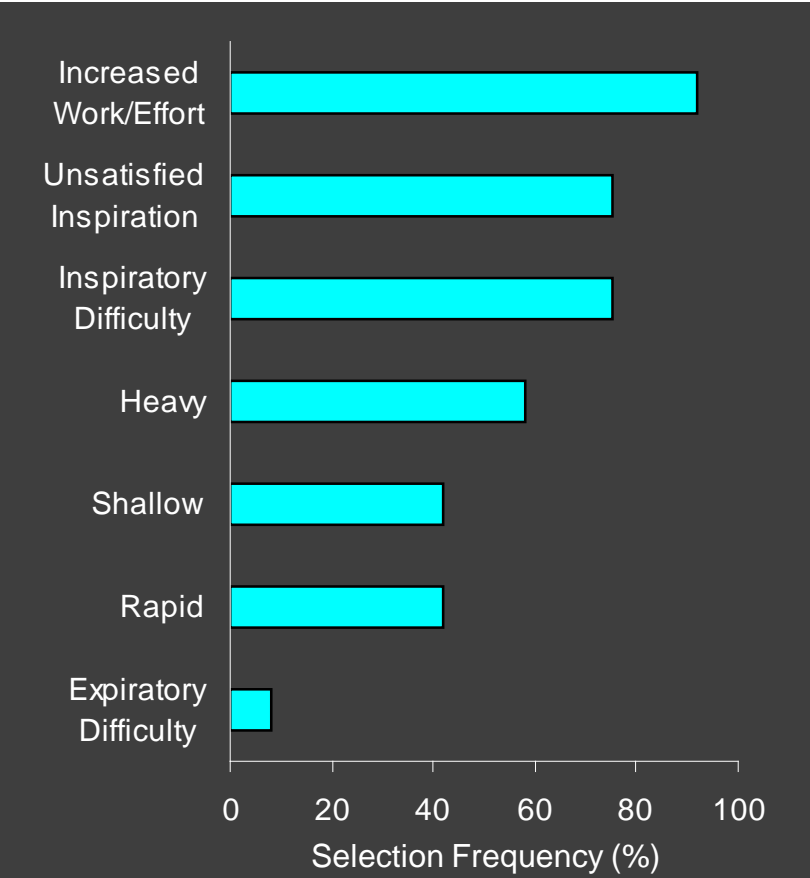

Quality of Exertional Dyspnoea

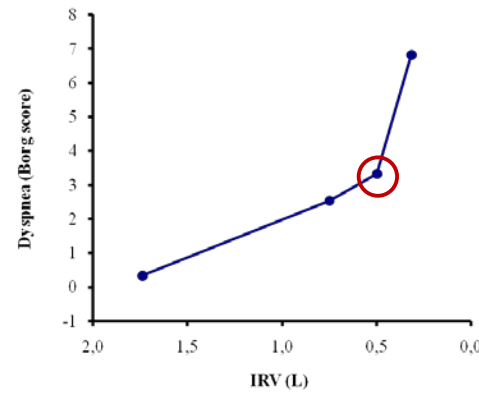

Exertional Dyspnoea in COPD during exercise
